Fomenko's Findings & Hypothesis,*

*Modeling Delta T,*

*Measuring LOD & Tides,*

*Retrodiction of Solar Eclipses*

*How Robust is Common Chronology?*

*Abstract :*

LLR & SLR data, collected over the last 45 years, provide crucial data over the time behaviour of the Length Of Day, i.e. LODs range of fluctuation at fortnightly, seasonal, yearly and decenial level.

Those limits comfort our smooth Earths deceleration Model explaining all reliable past observations of solar eclipses, including the one which occurred during the reign of Akhenaton, 3345 years ago.

1540.08.05 Joseph Just SCALIGER born in Agen.

1572: Escaped the St Barthélemy's massacre....

..flew to Geneva... nominated Professor of Philosophy

## 1583: Revolution in Natural Philosophy

*Galileo GALILEI* noticed *pendulum* might be used to *keep time*...

The son of *Julius Caesar « Della SCALA »* invented :

***Julian Days' linear time scale***

*the ideological « causal » tool so badly needed by the Reform*

## 1606: Invention of Chronology

*Thesaurus temporum* (Repertory of dates)

The author would like to express the wish for this seven-volume edition to provide an impetus for the development of new empirico-statistical methods of studying historical texts so that the problems of ancient chronology can be solved in their entirety.

Anatoly T. Fomenko

Fig. 2.6. The erroneous astronomical “solution” for the “Thucydides triad” of eclipses as offered by D. Petavius. The track of the lunar shadow for the first annular solar eclipse of 431 B.C. is represented by a dotted line. The track for the second solar eclipse of 424 B.C. is represented by a solid line, with the large dot standing for the zenith point of the lunar eclipse of 413 B.C. Taken from [544], Volume 4, page 505.

Fig. 2.9 The triad of eclipses described by the “ancient” Thucydides: 1133, 1140, and 1151 A.D. The solution was found by N. A. Morozov. One sees the lunar shadow tracks for the first two eclipses and the zenith visibility point for the lunar eclipse of 1151. Taken from [544], Volume 4, page 509.

The first solution (N.A. Morozov):

- 1133 A.D., 2 August (total solar);
- 1140 A.D., 20 March (total solar);
- 1151 A.D., 28 August (lunar).

The second solution (A.T. Fomenko):

- 1039 A.D., 22 August (total solar);
- 1046 A.D., 9 April (partial solar);
- 1057 A.D., 15 September (lunar).

*Naked eye observation of an annular SE*

A photograph of the sun partially obscured by dark, billowing clouds. The visible portion of the sun is bright yellow with a distinct black circular shadow in the center, characteristic of an annular solar eclipse. The surrounding sky is a deep, dark grey.
